Sieve: Budgeted Question-Conditioned Information Selection for Training-Free Long-Context Compression

Manuscript submitted to Information Processing & Management (Full Length Article)

- Long-context compression framed as budgeted question-conditioned selection.
- A training-free, model-free selector runs in milliseconds on one CPU core.
- Three-dataset frontier study spans accuracy, compression, and compressor cost.
- End-to-end QA with a production reader: seven methods, 100 records each.
- Reader-side positional profile is re-measured, not borrowed from prior work.
